

# ***Molecular Dynamics Simulations of Water and Ice by TIP5P Code***

*Motohiko Tanaka, Ph.D., Professor  
Graduate School of Chubu University  
Kasugai 487-8501, Japan*

# \* Simulation water starting from 298 K

Time  $t=82,600$  starting from 298 K with 1728 water molecules, imposed electric field 10 GHz in x-direction with  $E_0 = 5 \times 10^6$  V/cm and NV run (by 8.3 periods). Left: a) Total kinetic energy, b) rotational energy only, c) Coulombic energy, Lennard-Jones energy. The final temperature is about 405 K.

Right: Pair distribution functions of a) O-O atoms, b) O-H atoms in  $R=0-8$  Angstrom. O and H atoms are thus mixed showing heavy water interactions. Compare with the frozen ice of 230 K.

Water molecules starting 298 K.

Left: Scatter plot of water at  $t=80,000$ , b) x-directional cosine distribution for the cross bins of  $(-1.0, 1.0)$  at  $t=72,500$  to  $80,000$ . Due to phase lag of molecules compared to imposed electric field, water is largely heated,

## \* Simulation starting from ice at 230 K

At temperature 230 K of 1728 water molecules, AC electric field 10 GHz in the x-direction with intensity  $E_0 = 5 \times 10^6$  V/cm. Left: a) total kinetic energy, b) rotational energy only, c) Coulombic energy, d) Lennard-Jones energy, at the time of  $t=84,000$ . Right: cosine distribution of water in Bins  $(-1,1)$  of the x-direction. No oscillations are really found at the imposed electric field.

Time  $t=80,000$  of the temperature 230 K.  
Left: a) Pair distribution functions of O-O atoms  
b) O-H atoms for  $R=0-8$  Angstrom. Peaks are well separated at this temperature.  
Right: Scatter plot of water molecules where ice is frozen by 6-membered water clusters.
